Precision surface and profile grinding machine

CNC-Control

For a quick change-over of the machine, the data of workpieces, grinding wheels and dressers and the profile contours are stored in virtual file cabinets.

The input of all data is dialogue based.

All geometrical data can be entered as absolute values or using the Teach-In process.

For single production or adjustment, all axes can be controlled with the electrical hand wheel.

Different grinding processes are available and belong to the basic equipment of the machine.

The interlinking of several grinding cycles enables the operator to machine workpieces with different grinding tasks fully automatically.

Precision surface and profile grinding machine with CNC-control for highest requirements and flexibility

- Dialogue based input of the process parameters
- Taking over of the axes position with Teach-In-process
- Virtual file cabinets for the data of work pieces, grinding wheels and dressing unit for a quick change-over of the machine
- Comfortable realisation of contours for grinding wheels and workpieces
- Addition of further axes
- Addition of further grinding spindles
- Possibility of network connection and remote maintenance

DRESSING TECHNOLOGY

Automatic dressing from the table allows highest precision. All dressing amounts are compensated. The undercutting of the grinding wheel for face, plunge or gap grinding is achieved by a twin dresser.

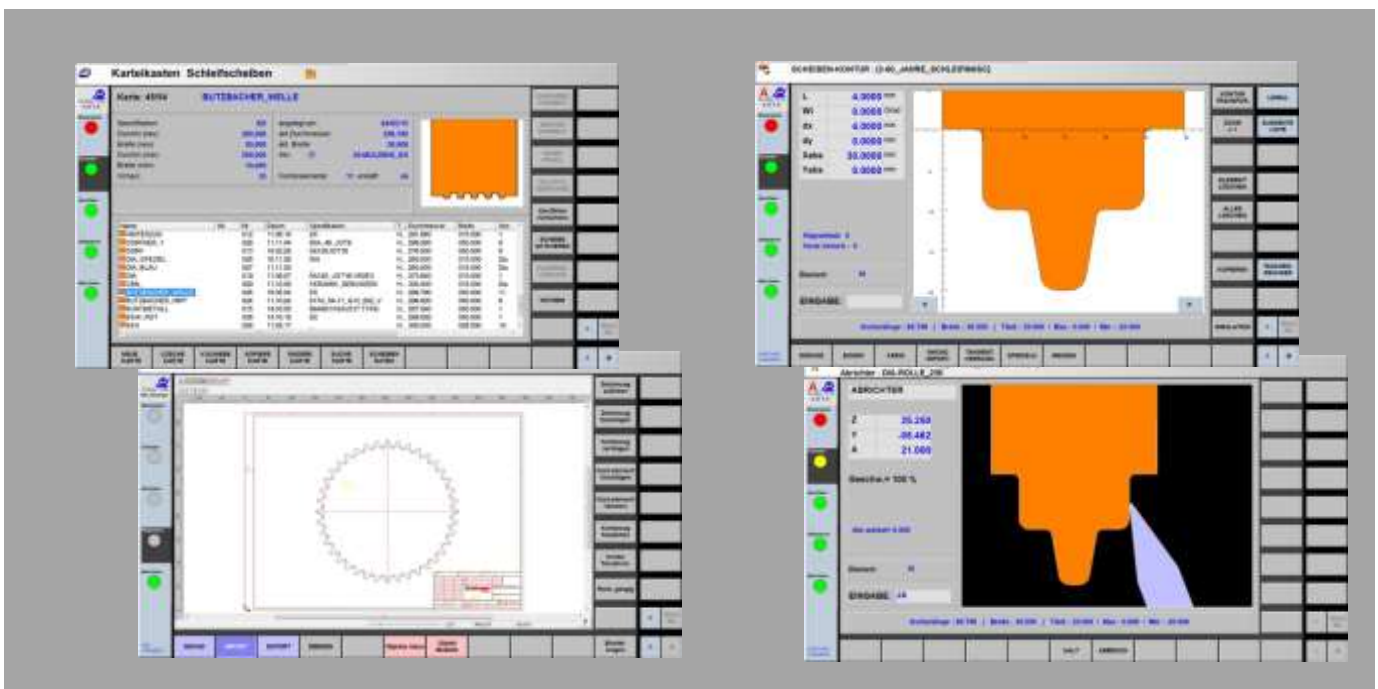

Profiles can be realised most simply by means of a standard data library or as contour lines.

Using the graphic support for the profile setup process and the integrated CAD program, virtually every grinding wheel profile can be created conveniently and rapidly.

The transfer of existing CAD-data is possible (CAD/CAM- interface).

The simulation enables to control of the dressing process and the time-optimised pre-dressing process for collision.

The swivel dresser is used for the profiling of grinding wheels with steep contours. Beside the conventional form-diamond, the device is equipped with a twin-diamond for highest precision. For serial production, a powered diamond disc gives the tool a long life. A maximum of flexibility and precision in combination with a very short setup time is made possible by the diamond precision fast change system (DPS).

Other dressing devices can be integrated into the machine on demand.

Vertical grinding spindle

A vertical grinding spindle allows internal round and coordinate grinding. With such a grinding spindle, it is also possible to treat T-slots or dovetail guides.

Rotative or swivelling axes

With integration of a rotative axis in form of a dividing head or a workpiece spindle, it is possible to realise multiple size operations, threads, circular or non-circular works.

Automation

An automatic workpieces infeed is also possible. The interface can be determined with the automation manufacturer.

Who we are:

On our site in Homberg (Ohm) in Hessen, precision grinding machines and their accessory equipment are being produced since 1956. Now, more than 10.000 manufactured machines are in action all over the world.

All machines that are supplied by Geibel & Hotz are assembled, put into service and subjected to an extensive quality control on our site in Homberg.

Thanks to the central situation of our company, every place in Germany can be reached by car within 8 hours. Service interventions can be arranged optimally for our customers from our location.
